

Recomendaciones y actividades sugeridas para el exito del laboratorio

Redux avanzado

Instalar reselect

Redux Toolkit ya lo incluye, pero si no:

`npm install reselect`

mejora en el slice

```
const slice = createSlice({
  name: 'blueprints',
  initialState: {
    authors: [],
    byAuthor: {},
    current: null,

    loading: {
      authors: false,
      blueprints: false,
      blueprint: false,
    },

    error: {
      authors: null,
      blueprints: null,
      blueprint: null,
    },
  },
  reducers: {
```

Y reducer

```

reducers: {

  /* OPTIMISTIC DELETE */
  deleteBlueprintOptimistic: (s, a) => {
    const { author, name } = a.payload

    if (!s.byAuthor[author]) return

    s.byAuthor[author] =
      s.byAuthor[author].filter(bp => bp.name !== name)
  },

  /* OPTIMISTIC UPDATE */
  updateBlueprintOptimistic: (s, a) => {
    const { author, name, points } = a.payload

    const bp = s.byAuthor[author]?.find(b => b.name === name)

    if (bp) {
      bp.points = points
    }

    if (s.current && s.current.author === author && s.current.name === name) {
      s.current.points = points
    }
  }
},

```

Luego se creo un memo selector

```

import { createSelector } from '@reduxjs/toolkit'

const selectBlueprintsState = (state) => state.blueprints
export const selectAllBlueprints = createSelector(
  [selectBlueprintsState],
  (blueprintsState) => {
    const all = Object.values(blueprintsState.byAuthor)

    // ...
  }
)

export const selectTopBlueprints = createSelector(
  [selectAllBlueprints],
  (blueprints) => {
    return [...blueprints]
      .sort((a, b) => (b.points?.length || 0) - (a.points?.length || 0))
      .slice(0, 5)
  }
)

```

```

import { createSelector } from '@reduxjs/toolkit'

const selectBlueprintsState = (state) => state.blueprints
export const selectAllBlueprints = createSelector(
  [selectBlueprintsState],
  (blueprintsState) => {
    const all = Object.values(blueprintsState.byAuthor)

    // ...
  }
)

export const selectTopBlueprints = createSelector(
  [selectAllBlueprints],
  (blueprints) => {
    return [...blueprints]
      .sort((a, b) => (b.points?.length || 0) - (a.points?.length || 0))
      .slice(0, 5)
  }
)

```

Obtener todos los blueprints y Top 5 por cantidad de puntos

```

const selectBlueprintsState = (state) => state.blueprints
export const selectAllBlueprints = createSelector(
  [selectBlueprintsState],
  (blueprintsState) => {
    const all = Object.values(blueprintsState.byAuthor)

    return all.flat()
  }
)

export const selectTopBlueprints = createSelector(
  [selectAllBlueprints],
  (blueprints) => {
    return [...blueprints]
      .sort((a, b) => (b.points?.length || 0) - (a.points?.length || 0))
      .slice(0, 5)
  }
)

```

En la UI se implemento un sistema de mensajes de si esta cargando el get o un mensaje de error si no lo encuentra, también se implemento el top 5 de blueprints que tengan más puntos

Error loading blueprints:
Request failed with
status code 404

Rutas protegidas

Si hay token → deja entrar

Si no hay token → redirige al login

```
src > routes > PrivateRoute.jsx > PrivateRoute
1  import { Navigate } from 'react-router-dom'
2
3  export default function PrivateRoute({ children }) {
4
5      const token = localStorage.getItem('token')
6
7      if (!token || token === "null" || token === "undefined") {
8          return <Navigate to="/login" replace />
9      }
10
11     return children
12 }
```

```

1 import { NavLink, Route, Routes } from 'react-router-dom'
2 import BlueprintsPage from './pages/blueprintsPage.jsx'
3 import BlueprintDetailPage from './pages/blueprintDetailPage.jsx'
4 import LoginPage from './pages/loginPage.jsx'
5 import NotFound from './pages/NotFound.jsx'
6 import PrivateRoute from './routes/PrivateRoute.jsx'
7
8 export default function App() {
9   return (
10     <div className="container">
11       <header>
12         <h1>ECI - Laboratorio de Blueprints en React</h1>
13
14         <nav>
15           <NavLink to="/" end>
16             Blueprints
17           </NavLink>
18
19           <NavLink to="/login">
20             Login
21           </NavLink>
22         </nav>
23       </header>
24
25       <Routes>
26         <Route
27           path="/"
28           element={
29             <PrivateRoute>
30               <BlueprintsPage />
31             </PrivateRoute>
32           </>
33         </Route>
34
35         <Route
36           path="/blueprints/:author/:name"
37           element={
38             <PrivateRoute>
39               <BlueprintDetailPage />
40             </PrivateRoute>
41           </>
42         </Route>
43
44         <Route path="/login" element={ <LoginPage /> } />
45
46         <Route path="" element={ <NotFound /> } />
47       </Routes>
48     </div>
49   )
50 }

```

Estos códigos hacen que si al ejecutar el programa entra directamente a /blueprints/login debido a que no permite que un usuario no entre sin haber iniciado sesión al /blueprints/ si se intenta ir a esa ruta cambia automáticamente a login

CRUD completo

en el back se implementó los siguientes endpoints ya que no existían y tras ellos toda su lógica

```

        @io.swagger.v3.oas.annotations.responses.ApiResponse(responseCode = "200", description = "Blueprint actualizado")
        @io.swagger.v3.oas.annotations.responses.ApiResponse(responseCode = "404", description = "Blueprint no encontrado")
    })
    @PutMapping("/{author}/{name}")
    public ResponseEntity<ApiResponse<Void>> updateBlueprint(
        @PathVariable String author,
        @PathVariable String name,
        @Valid @RequestBody UpdateBlueprintRequest req) {

        try {

            Blueprint bp = new Blueprint(author, name, req.points());
            services.updateBlueprint(bp);

            return ResponseEntity.ok(
                new ApiResponse<>(200, "Blueprint updated", null));

        } catch (BlueprintNotFoundException e) {

            return ResponseEntity.status(HttpStatus.NOT_FOUND)
                .body(new ApiResponse<>(404, e.getMessage(), null));

        }

    }

    // DELETE /blueprints/{author}/{name}
    @Operation(summary = "Eliminar un blueprint", description = "Elimina un blueprint existente identificado por autor y nombre")
    @ApiResponses({
        @io.swagger.v3.oas.annotations.responses.ApiResponse(responseCode = "200", description = "Blueprint eliminado correctamente")
        @io.swagger.v3.oas.annotations.responses.ApiResponse(responseCode = "404", description = "Blueprint no encontrado")
    })
    @DeleteMapping("/{author}/{name}")
    public ResponseEntity<ApiResponse<Void>> delete(
        @PathVariable String author,
        @PathVariable String name) {

        try {

            services.deleteBlueprint(author, name);

            return ResponseEntity.ok(
                new ApiResponse<>(200, "Blueprint deleted", null));

        } catch (BlueprintNotFoundException e) {

            return ResponseEntity.status(HttpStatus.NOT_FOUND)
                .body(new ApiResponse<>(404, e.getMessage(), null));

        }

    }

}

```

y luego se hizo que slice pudiera utilizar esos endpoints

```

/* UPDATE */
export const updateBlueprint = createAsyncThunk(
    'blueprints/updateBlueprint',
    async ({ author, name, points }) => {
        await service.update(author, name, { points })
        return { author, name, points }
    }
)

/* DELETE */
export const deleteBlueprint = createAsyncThunk(
    'blueprints/deleteBlueprint',
    async ({ author, name }) => {
        await service.remove(author, name)
        return { author, name }
    }
)

```

```

const slice = createSlice({
  name: 'blueprints',
  initialState: {
    authors: [],
    byAuthor: {},
    current: null,

    loading: {
      authors: false,
      blueprints: false,
      blueprint: false,
    },

    error: {
      authors: null,
      blueprints: null,
      blueprint: null,
    },
  },

  reducers: {

    /* OPTIMISTIC DELETE */
    deleteBlueprintOptimistic: (s, a) => {
      const { author, name } = a.payload

      if (!s.byAuthor[author]) return

      s.byAuthor[author] =
        s.byAuthor[author].filter(bp => bp.name !== name)
    },

    /* OPTIMISTIC UPDATE */
    updateBlueprintOptimistic: (s, a) => {
      const { author, name, points } = a.payload

      const bp = s.byAuthor[author]?.find(b => b.name === name)

      if (bp) {
        bp.points = points
      }

      if (s.current && s.current.author === author && s.current.name === name) {
        s.current.points = points
      }
    }
  }
})

```

Después en la UI se implementó tres botones uno que añade un punto en una ubicación aleatoria, otro de un punto en posición fija y por ultimo uno que elimina el plano

Add Point

X Coordinate

Y Coordinate

CancelAdd Point

Operación Endpoint Redux

Create	POST	createBlueprint
Read	GET	fetchBlueprints
Update	PUT	updateBlueprint
Delete	DELETE	deleteBlueprint

Dibujo interactivo

Permitir **agregar puntos haciendo click**

Mantener los puntos **localmente mientras se dibuja**

Tener un botón **Guardar** que envíe el blueprint al backend

```
// agregar punto con click
const handleClick = (e) => {

  const canvas = ref.current
  const rect = canvas.getBoundingClientRect()

  const scaleX = canvas.width / rect.width
  const scaleY = canvas.height / rect.height

  const x = Math.round((e.clientX - rect.left) * scaleX)
  const y = Math.round((e.clientY - rect.top) * scaleY)

  setLocalPoints((prev) => [...prev, { x, y }])
}

const handleMove = (e) => {

  const canvas = ref.current
  const rect = canvas.getBoundingClientRect()

  const scaleX = canvas.width / rect.width
  const scaleY = canvas.height / rect.height

  const x = Math.round((e.clientX - rect.left) * scaleX)
  const y = Math.round((e.clientY - rect.top) * scaleY)

  setMousePos({ x, y })
}
```

```
</div>
<button
  className="btn btn-success btn-sm"
  onClick={handleSave}
>
  Guardar Blueprint
</button>

<button
  className="btn btn-secondary btn-sm"
  onClick={handleClear}
>
  Limpiar
</button>

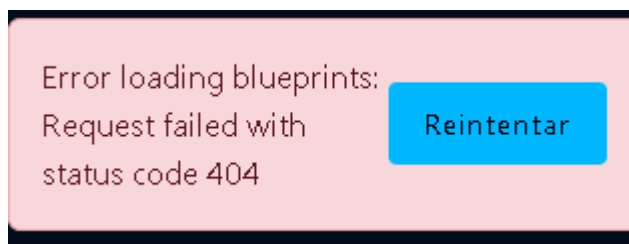

</div>
</div>
)
```

Se edito el canvas para que al hacer click en el plano se cree un punto y cuando le de a save lo guarda en el endpoint

Errores y Retr

En este punto se agregó un botón de reintentar cuando no falla una consulta, el mensaje de error se programo posteriormente antes de esté punto

```
<button
  className="btn btn-sm btn-light"
  onClick={retryFetch}
  disabled={loading.blueprints}
>
  Reintentar
</button>

</div>
```

Testing

```
✓ tests/BlueprintsPage.test.jsx (1 test) 235ms

Test Files  4 passed (4)
Tests       12 passed (12)
Start at    22:06:42
Duration    6.85s (transform 903ms, setup 1.98s, collect 4.83s, tests 566ms, environment 14.35s, prepare 1.72s)
```

se modificaron los test para que cubrieran los casos modificados ya que los test que estaban previamente en requerimientos están desactualizados.

CI/Lint/Format

All checks have passed ×

1 successful check

✓  node-ci / build (push) Successful in 15s [Details](#)

The screenshot shows the GitHub Actions interface for a workflow run. On the left, a sidebar contains a 'Summary' link, 'All jobs' (with a dropdown menu), and 'Run details' (with links for 'Usage' and 'Workflow file'). The 'build' job is selected and highlighted. The main panel shows the job's status as 'succeeded 13 hours ago in 15s'. Below this, a list of steps is displayed, each with a checkmark icon and a duration. The 'Run npm test' step is highlighted. An 'Annotations' section at the top right indicates '1 warning'.

Step	Duration
> ✓ Set up job	1s
> ✓ Run actions/checkout@v4	0s
> ✓ Run actions/setup-node@v4	2s
> ✓ Run npm ci npm install	3s
> ✓ Run npm run lint	1s
> ✓ Run npm test	3s
> ✓ Run npm run build	2s
> ✓ Post Run actions/setup-node@v4	0s
> ✓ Post Run actions/checkout@v4	0s
> ✓ Complete job	0s

Al pasar las pruebas funciona correctamente el git actions que estaba programado en este repositorio

Docker (opcional)

se modifiko todos los archivos de docker

```
> REin Aa ab * No re

# Build stage
FROM node:20-alpine AS build
WORKDIR /app

COPY package*.json ./
RUN npm ci || npm install

COPY . .
RUN npm run build

# Server stage
FROM node:20-alpine
WORKDIR /app

RUN npm i -g serve

COPY --from=build /app/dist ./dist

EXPOSE 4173

CMD ["serve", "-s", "dist", "-l", "4173"]
```

```
D Run Service
backend:
  build: ../Laboratorio-5-ARSH
  container_name: blueprints-backend
  ports:
    - "8080:8080"

D Run Service
web:
  build: .
  container_name: blueprints-frontend
  ports:
    - "5173:4173"
  environment:
    - VITE_API_BASE_URL=http://backend:8080/api
  depends_on:
    - backend
```

```
1 # syntax=docker/dockerfile:1
2 FROM maven:3.9-eclipse-temurin-21 AS build
3 WORKDIR /app
4
5 COPY pom.xml .
6 RUN mvn -B -f pom.xml dependency:go-offline
7
8 COPY src ./src
9 RUN mvn -B -DskipTests package
10
11 FROM eclipse-temurin:21-jre
12 WORKDIR /app
13
14 COPY --from=build /app/target/*.jar ./app.jar
15
16 EXPOSE 8080
17
18 ENTRYPOINT ["java", "-jar", "/app/app.jar"]
```

Y se levanto la imagen con el siguiente comando

`docker compose up --build`

y esto hace que funcionen los siguientes links

<http://localhost:8080/actuator/health>

<http://localhost:8080/swagger-ui/index.html>

<http://localhost:5173>
